This is a document for testing purposes. We are looking to see the impact of indexifembedded and if by any chance it will allow the indexing of content that is embedded, or if it only impacts whether or not the page hosting the embedded object can be indexed.

This is a very basic experiment. Based on the outcome, we anticipate knowing a few things

1. Does a noindex tag on embedded content prevent the hosting page from being indexed
2. Does an indexifembedded tag allow the hosting page to be indexed if the embedded content is noindexed
3. Does Google consider the content contained in an embed as part of the content of the page that is hosting the embed.
